

Scenario 2

Inference validation

Model A:

sympatric speciation rate is diversity-dependent

- Time has been fixed to $T=8$ for simulating and estimating parameters
- 10 simulated data have been generated by fixing extinction rate in the North to 1
- Sample size per generation = 400
- Generations = 7
- $q=0.5$
- Maximum number of species allowed 150

Scenario 2

Estimates from Empirical data

Model A:

sympatric speciation rate is diversity-dependent

- Estimating parameters for empirical data while fixing extinction rate in the north to 1
- $T=8$
- Sample size = 400
- $q=0.5$
- Number of generation = 7
- Maximum number of species = 150
